To get a copy of this PDF, just click "Articles" on our Website.

Here we show what I would like to call the Standard Method of wiring a 3-Way and a 4-Way lighting circuit. As you progress in your Electrical education and start working as an apprentice, journey-person and then perhaps to a Master Licensed Electrician, you will encounter different methods of how other Electricians wired up those 3-Way and 4-Way switches. The most important thing to remember is Safety and to have a clear understanding of something called an Effective Ground Fault Current Path. Please read this definition which is in Article 100 of your National Electrical Code book. If you do not have your code book, you can buy one by going back to our website and clicking on the link at the top of our page. We occasionally update these PDF's and if you would like to be notified of new versions, simply go to our website, ElectricalTime.com and click Subscribe so that you can see our new videos when they are ready and where we will let you know about updated PDF documents and articles. Thank you, Steve Kavallaris, Electrical Instructor for ElectricalTime.com
